# 1. Glossary

**Flood warning:** Flood Warnings are issued when flooding at a forecast location is expected to reach and/or exceed a flood classification (or has already done so) in a river catchment where the Bureau offers a Flood Warning service. A Flood Warning may also be issued when a flood classification has been reached or exceeded, in one or more locations (including at multiple information locations), or as specified in the service level specification. Flood Warnings are updated at an appropriate frequency to the catchment and flood severity, as defined in the Bureau's Service Level Specification.

**Flood watch:** A Flood Watch provides early advice of increased flood risk over an area up to four days before the onset of possible flooding. A Flood Watch is issued when hydrological and meteorological guidance indicates that at least minor flooding is possible at forecast locations and/or when guidance indicates an increased risk of flooding causing impacts, in consultation with emergency management agencies. The Flood Watch product is provided for all catchments in Queensland.

**National Emergency Management Agency:** The Australian Government National Emergency Management Agency has been designed to connect relevant Australian Government, State and Territory agencies to centralise the coordination and management of the national-level response during complex national emergencies, developing a single, timely and consistent picture or understanding of a crisis, its implications and the national capacity to respond.

[Intergovernmental Agreement on the provision of Bureau of Meteorology Hazard Services to States and Territories](#) formalises and standardises the services provided to State and Territory Emergency Services Agencies and clarifies responsibilities between all levels of government for Flood management, Fire Weather management and management of Extreme Weather and Hazard Impact Events.

**Severe Thunderstorm:** A thunderstorm is characterised by sudden electrical discharges, each manifested by a flash of light (lightning) and a sharp rumbling sound. Thunderstorms are associated with convective clouds (cumulonimbus) and are usually accompanied by precipitation. Thunderstorms are often short-lived and impact on only a small area. Severe thunderstorms may last for an hour or more and can have a more widespread impact. These warnings are issued when set thresholds are met as defined in the [Thunderstorm and Severe Weather Service Level Specification](#)

A severe thunderstorm will also have one or more of the following phenomena:

- Tornado
- Wind gust of 90 km/h (49 knots) or more
- Hailstones with diameter of 2 cm or larger
- Very heavy rain sufficient to cause flash flooding

**Weather Warnings:** Weather warnings are messages sent out by the Bureau to warn the community of potentially hazardous or dangerous weather conditions for both coastal and land-based weather events. Such warnings include but are not limited to: road weather alerts, severe thunderstorm warnings, severe weather warnings for heavy rain, strong or gale force winds,

## Service Level Specification for Flood Forecasting and Warning Services for Queensland

coastal hazard warnings for damaging surf or abnormally high tides, marine wind warnings, warnings for sheep graziers and frost warnings. More information on weather terms is given in the [Bureau's glossary](#).

### The components of the Total Flood Warning System

Based on the [Manual 21 Australian Emergency Manual Series, Australian Government 2009](#) (see the Manual for more details).

**Communication:** disseminating warning information in a timely fashion to people and organisations likely to be affected by the flood (see Chapter 6).

**Interpretation:** identifying in advance the impacts of the predicted flood levels on communities at risk (see Chapter 4).

**Message construction:** devising the content of the message which will warn people of impending flooding (see Chapter 5).

**Monitoring and prediction:** detecting environmental conditions that lead to flooding, and predicting river levels during the flood (see Chapter 3),

**Review:** examining the various aspects of the system with a view to improving its performance (see Chapter 7).

**Flood classifications:** The classification of minor, moderate and major flood levels at key river height stations is based upon the effect of flooding for some distance upstream and downstream of that station. These levels are determined using the following descriptive categories of flooding, historical data or relevant local information.

The process for establishing flood class levels involves determining local flood effects, review and endorsement by relevant stakeholders and passing recommendations to the Bureau for inclusion in forecast and warning procedures. The process for the establishment of flood class levels specific to each State and Territory is documented in the QRA flood classification guidance which provides more context for QLD ([Flood classifications in Queensland | Queensland Reconstruction Authority \(qra.qld.gov.au\)](#)).

**Minor flooding:** Causes inconvenience. Low-lying areas next to watercourses are inundated. Minor roads may be closed, and low-level bridges submerged. In urban areas inundation may affect some backyards and buildings below the floor level as well as bicycle and pedestrian paths. In rural areas removal of stock and equipment may be required.

**Moderate flooding:** In addition to the above, the area of inundation is more substantial. Main traffic routes may be affected. Some buildings may be affected above the floor level. Evacuation of flood affected areas may be required. In rural areas removal of stock is required.

**Major flooding:** In addition to the above, extensive rural areas and/or urban areas are inundated. Many buildings may be affected above the floor level. Properties and towns are likely to be isolated and major rail and traffic routes closed. Evacuation of flood affected areas may be required. Utility services may be impacted.

## 2. Introduction

### 2.1. Purpose

The purpose of the Service Level Specification (SLS) is to document and describe the riverine flood forecasting and warning services provided by the Bureau of Meteorology (the Bureau) in Queensland.

Flood warning in Australia involves all levels of government (Commonwealth, state, territory and local), regional authorities and organisations that contribute to data observing networks, and communities. The development and implementation of flood warning system require a cooperative approach involving each of these stakeholders.

Figure 1 Total Warning System

Roles and responsibilities for flood warning services are detailed in the National Arrangements for Flood Forecasting and Warning (BOM 2018) and are affirmed by the [Intergovernmental Agreement on the Provision of Bureau of Meteorology Hazard Services](#) (the IGA) to the States and Territories. These are reflected in the membership of Flood Warning Consultative Committees servicing jurisdictions across Australia.

## Service Level Specification for Flood Forecasting and Warning Services for Queensland

This SLS outlines the flood warning related products, issuance times and target levels of service constitute the current standard services that the Bureau is funded to provide. The Bureau also provides supplementary services on a cost recovery basis. Supplementary services are not covered in this document.

This SLS is concerned with describing the Bureau's role in the Total Flood Warning System and its interaction with other stakeholders as described in the IGA and the National Arrangements. This is to ensure that the service the Bureau is providing in support of each of the relevant components of the Total Flood Warning System is understood by the Bureau and other stakeholders.

The Bureau also contributes to activities designed to strengthen organisational readiness and build community resilience and participates in the planning and coordination of activities with disaster mitigation agencies.

## 2.2. Scope

The scope of services covered by this SLS is confined to those dealing with riverine flooding caused by rainfall where typical rain-to-flood times are six hours or more. Flash flooding (rain-to-flood times less than six hours) and flooding caused purely by elevated sea levels are not covered.

The weather forecasting and other services the Bureau provides that contribute to the flood forecasting and warning service, including Severe Weather Warnings, Severe Thunderstorm Warnings are covered in the [Thunderstorm and Severe Weather Service Level Specification](#), Tropical Cyclone Warnings are covered in the [Tropical Cyclone Service Level Specification](#) and the provision of radar data and rainfall forecasts.

This SLS includes undertaking the routine catchment monitoring and river height prediction activities necessary for the operation of the Total Flood Warning System. It also outlines issuing and publishing specific warning and data products. These activities are listed below.

- Collect and publish rainfall and river level data
- Routine monitoring of flood potential
- Flood modelling and prediction
- Automated information and alerting
- Issue flood watches
- Issue flood warnings
- Communication of flood warnings and flood watches
- Data networks, communications and storage
- Operations
- Maintain systems to collect data and flood information
- Planning and liaison
- Support for emergency management training and training exercises

Note that further detail and associated performance measures are provided in subsequent sections of this document.

### 2.2.1. Collect and publish rainfall and river level data

The collection and publishing of rainfall and river levels is an important component of the overall service. The Bureau utilises this information for data analysis and its hydrological modelling for flood predictions. The data is also used by the emergency service agencies, numerous operational agencies, businesses and the public to monitor rainfall and river conditions.

## Service Level Specification for Flood Forecasting and Warning Services for Queensland

To assist in describing the service, the locations where river height; dam, weir or lake level; and tidal observations are made are categorised into three types; namely forecast location (Schedule 2: Forecast locations and levels of service), information location (Schedule 3: Information locations with flood class levels defined) and data location (Schedule 4: River data locations).

- **Forecast location** is a location for which the Bureau provides a forecast of future water level either as the class of flood that is predicted (minor, moderate or major) or as a level and class – refer to Appendix A for definitions. At these locations observed data, flood classifications and additional qualifying information will also be available (Schedule 2: Forecast locations and levels of service).
- **Information location** is a location at which flood classifications are defined, and observations of water level data are provided. At these locations forecasts of future water level are not produced. Other key thresholds may be defined and reported against (Schedule 3: Information locations with flood class levels defined).
- **Data location** is a location for which just the observed water level data is provided. Flood classifications are not available for these locations and forecasts of future water level are not produced (Schedule 4: River data locations).

An indicative level of priority has been assigned to each observing site and key communication infrastructure such as radio repeaters based on a three-tiered scheme (Table 1).

The priority level is based on the expected impact on the Bureau's services. The impacts identified are the expected outcome of a service outage at that site during a flood emergency. Impact is described in terms of forecast performance and the Bureau's ability to provide a flood warning service.

Note that the scope of this priority scheme is limited to consideration of the requirements of forecasting and prediction only and should not be confused with any other priority assigned to that site by third-party owners or other users.

**Table 1: Site priority**

| Priority Level | Impact on performance                | Impact on service delivery                                                        | Description                                                        |
|----------------|--------------------------------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------|
| High           | Very difficult to meet target        | Direct and significant high-level impact for the site and/or downstream locations | Degradation of service highly likely.                              |
| Medium         | Difficult to meet target             | Some impact for the site and/or downstream locations.                             | Possible degradation of service.                                   |
| Low            | Not likely to affect meeting targets | Little impact on the site and/or downstream location                              | No change in service. Lower possibility of degradation of service. |

**Note:** Multiple outages within a given network will lead to a higher impact and greater service degradation. Table 1 indicates the effect of a single failure within an otherwise functional network.

### **2.2.2. Routine monitoring of flood potential**

The Bureau will maintain an awareness of catchment conditions and monitor the potential for riverine flooding. This monitoring activity will be supported by the Bureau's weather services as required and is an activity undertaken to plan future flood operations.

### **2.2.3. Flood modelling and prediction**

The Bureau will develop and maintain prediction systems for the forecast locations listed in Schedule 2: Forecast locations and levels of service.

The Bureau prediction systems can include real-time hydrologic models, simple peak to peak correlations and other hydrologic techniques as appropriate.

The Bureau prediction systems will be maintained and updated following significant events or when new data becomes available.

The target level of performance for the prediction at each forecast location is given in Schedule 2: Forecast locations and levels of service.

### **2.2.4. Issue flood watches**

The Bureau will issue flood watches when the combination of forecast rainfall and catchment conditions indicates flooding is possible. The catchments and basins covered by flood watches include all those listed in Schedule 10: Flood warning related products issued by the Bureau in Qld (warnings, watches, bulletins). Note that flood watches may cover catchments that do not have established flood warning services.

The primary purpose of a flood watch is to provide early advice to communities and relevant emergency service organisations about the potential flood threat from a developing weather situation. Typically, a flood watch is issued 1 to 4 days before an anticipated flood event depending on the confidence in rainfall forecasts.

Flood watches will be communicated by the Bureau using the dissemination methods detailed in Flood watches table within Schedule 10: Flood warning related products issued by the Bureau in Qld (warnings, watches, bulletins).

### **2.2.5. Issue flood warnings**

In general flood warnings are issued based on the following criteria:

- The river level of at least one forecast location (listed in Schedule 2: Forecast locations and levels of service) is expected to reach and or exceed or has exceeded the minor flood level;
- The flood class levels or trigger heights defined at forecast locations are expected to be exceeded (refer to Schedule 2: Forecast locations and levels of service);
- River levels above the minor flood levels are expected at widespread information locations (refer to Schedule 3: Information locations with flood class levels defined).

The specific initiating criteria, if any, for each flood warning product are listed in Schedule 10: Flood warning related products issued by the Bureau in Qld (warnings, watches, bulletins).

## Service Level Specification for Flood Forecasting and Warning Services for Queensland

Flood warnings may include either qualitative or quantitative predictions at forecast locations or a statement about future flooding in more generalised terms as outlined in Table 2.

The type of prediction included is commensurate with user requirements, the availability of real time rainfall and river level data, and the capability of available flood prediction systems.

A flood warning may contain generalised, quantitative and qualitative predictions and typically start with more generalised information and become more specific as data becomes available as the event develops and progresses.

**Quantitative predictions** include expected flood class (minor, moderate or major) with more specific information on the height and time of water levels at the forecast locations identified in Schedule 2: Forecast locations and levels of service.

A quantitative prediction can be a specific level or a range of levels and has detailed timing down to blocks of a minimum of 3-6 hours. Quantitative predictions are based on all available information at the time of warning issue.

The target lead time of the river height prediction for each forecast location where quantitative predictions are provided is given in Schedule 2: Forecast locations and levels of service. For an example of a quantitative prediction refer to Table 2.

For the Bureau to be able to provide a quantitative prediction at a location, it is essential to have a suitable network of rainfall and river level sites upstream with data coming in real time, sufficient historical data to calibrate the flood forecasting model, a reliable rating table and documented flood impacts and flood classifications.

**Qualitative predictions** include expected flood class (minor, moderate or major) and timing of flooding at the forecast locations identified in Schedule 2: Forecast locations and levels of service. The timing is indicated in blocks of six, 12 or 24 hours, using terms such as early morning, afternoon or overnight.

Such predictions are based on all available information at that time and may include advice on the peak classification that is expected or has occurred at that location.

The target lead time for each forecast location where only qualitative predictions are provided is given in Schedule 2: Forecast locations and levels of service. For an example of a qualitative prediction refer to Table 2.

For the Bureau to be able to provide a qualitative prediction at a location, it is essential to have at least some rainfall and river level sites upstream of the location with data coming in real time, at least some historical flood data to calibrate the flood forecasting model, a reasonable rating table and documented flood impacts and flood classifications.

**Generalised predictions** The Bureau may also issue flood warnings with more generalised predictions and information when there is not enough data to make specific predictions or in the developing stages of a flood. These warnings contain generalised statements advising that flooding is expected and may include forecast trend (rising or falling) (for examples refer to Table 2).

## Service Level Specification for Flood Forecasting and Warning Services for Queensland

The typical target accuracy of a quantitative water level prediction is that 70% are within 0.3 or 0.6 metres of the observed water level. Specific accuracy targets by location are defined in Schedule 2: Forecast locations and levels of service.

Achievement of these targets is not possible in all floods or at all locations. In general, predictions of a flood peak are more accurate than “reach” or “exceed” predictions that are issued during the developing stages of a flood.

This is due to the uncertainty of future rainfall rates and/or upstream floodplain behaviour that are used when making those predictions.

A list of the flood warnings issued in Queensland, along with the basin/river to which they apply is included in Schedule 10: Flood warning related products issued by the Bureau in Qld (warnings, watches, bulletins). Schedule 10: Flood warning related products issued by the Bureau in Qld (warnings, watches, bulletins). Details about forecast locations in each basin/river are included in Schedule 2: Forecast locations and levels of service.

**Table 2. Prediction type description**

| Prediction type     | Height prediction                                                                 | Time of prediction                                 | Example                                                                                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Quantitative</b> | Numerical prediction<br>- Any Height<br>- Peak Height<br>Can refer to flood class | More specific, typically in blocks of 3 to 6 hours | The Tully River at Euramo will exceed the minor flood level (6.0 metres) during Saturday afternoon, continuing to rise overnight Saturday before peaking at an expected level of 9.2 metres (major) about 6pm Sunday. |
| <b>Qualitative</b>  | Refers to flood class (minor, moderate or major)                                  | Range of times (6, 12 or 24 hour blocks)           | Minor flooding is expected in the Murray River at Murray Flats during Saturday afternoon, and is expected to peak above the major flood level during Sunday evening.                                                  |
| <b>Generalised</b>  | No height prediction<br>- forecast trend (rising or falling)                      | Range of times (24 hour blocks)                    | River rises and flooding are expected in the Calliope River during Saturday the 18 <sup>th</sup> of December with higher levels possible                                                                              |

### 2.2.6. Communication of flood warnings and flood watches

Flood watches and warnings will be issued directly to a list of stakeholders with emergency management responsibilities. The list is maintained by the Bureau but is not detailed in this document. The direct dissemination methods supported include email, the internet protocols such as File Transfer Protocol (FTP).

The format of messaging in flood-related products will conform to a nationally consistent standard determined by the Bureau, in consultation with the Flood Warning Consultative Committee.

Flood watches and warnings are also communicated by the Bureau via the following channels:

- **Radio:** Radio stations, particularly the ABC, broadcast flood warning information as part of their news bulletins, or whenever practicable. This form of broadcast may be covered in separate agreements between the Bureau and broadcasters.
- **Weather warning service:** Flood warning information is recorded on a contracted telephone information service. Calls to this service incur a fee-for-service charge.

## Service Level Specification for Flood Forecasting and Warning Services for Queensland

- **Internet:** Flood watches and warnings are published on the Bureau's public web site and available by File Transfer Protocol (FTP) and Rich Site Summary (RSS) along with related rainfall and river level information (see 3.12).
- **Social media:** The Bureau endeavours to issue social media posts on its platforms related to flood watches, flood warnings and relevant information, subject to operational constraints and in connection with other weather information. The Bureau website remains the main platform for the publishing of flood information.
- **Bureau App:** The Bureau's app has push notifications from which users can opt to receive Flood Watches and Flood Warnings.

Emergency management partners and media can also access flood level and warning information directly from the National Water Operations Team, subject to operational constraints. The Bureau does not publish to the public the contact details of its operational teams.

### 2.2.7. Data networks, communications and storage

The services to be provided by the Bureau under this SLS depend on the provision of data from networks of stations owned and operated by the Bureau and partner agencies.

Permanent or temporary loss of real time data may necessitate a downgrading of the flood warning service from quantitative predictions to qualitative or generalised.

### 2.2.8. The Bureau contribution to this network of stations includes:

- The operation and maintenance of equipment at the sites which are fully owned and maintained by the Bureau as listed in Schedule 7: List of sites owned and maintained by the Bureau.
- Assisting with maintenance of equipment for other agencies at the sites listed in Schedule 8: List of sites where the Bureau assists other agencies with maintenance.
- Operating and maintaining Bureau-owned equipment at sites where this equipment is co-located at a site owned by another agency Schedule 9: List of sites where the Bureau co-locates equipment and the site is owned by another agency.

Where the site is owned or operated by other parties, installation, maintenance and repairs of Bureau equipment will depend on adequate access being provided to the Bureau and any of its contractors. The Bureau will confirm access arrangements with relevant landowners before entering the premises. The Bureau also requires that the site operators provide timely advice regarding any possible faults or other issues affecting the performance of the data network.

The flood forecasting and warning service for Queensland also depends on the provision of data from partner agency data networks.

The [Water Act 2007](#) gives us the function to collect, hold, manage, interpretate and disseminate information about Australia's water resources, and the use and management of water in Australia.

The [Water Regulations 2008](#) were created to help implement and enforce the Water Act and set out the rules and requirements for what data is provided to the Bureau, by who, how and when.

Current requirements, under the Regulations, are for named providers to provide the data they have in their custody, possession or control including Category 11-Water information for flood warning purposes. The regulations require the information hourly, but this is the minimum standard and it can be provided more frequently.

## Service Level Specification for Flood Forecasting and Warning Services for Queensland

The Bureau will maintain the essential set of metadata describing the network of stations and related infrastructure regarding the Bureau's component of the data network, along with metadata required to inform the data ingest process for partner agency related networks and sites.

All remaining Data Sharing Agreements will be terminated in due course.

The Bureau will discontinue its software support for external Enviromon users on 30 June 2026. It is important to note that Enviromon will not be switched off, and the application can continue to be used after this time, free of charge.

The Bureau has been engaging with external users since 2024 to support them through this transition. The Bureau will continue providing limited free of charge software support to external users with an Enviromon license until 30 June 2026 as specified in the relevant Flood Service Level Specifications (Schedule 5: Enviromon base stations installed in Queensland).

### **2.2.9. Operations**

The Bureau will use reasonable endeavours to provide 24 hours a day, seven days a week operational systems capability necessary to support flood warning operations in Queensland. This will include on-line computer and data ingestion systems, along with appropriate communications infrastructure. This will be subject to event requirements and operational constraints. The Bureau will advise its key emergency management clients of any impact on services if it is unable to provide sufficient staff coverage to meet the service levels set out in this SLS.

The Bureau will maintain an internal Technical Guides for each flood warning product. The Technical Guide documents and describes the forecast process for the particular catchment and includes flood intelligence information, flood history and warning issue criteria.

The Bureau's operation of the flood warning service will be compliant with the fatigue management guidelines developed under the Bureau's Work Health and Safety Procedures. Particular attention to fatigue management will be provided during the management of extreme events. The requirement to comply with these guidelines applies to all Bureau personnel.

The Bureau will assist in meeting the needs of the Australian Government's National Situation Room. The Bureau will use reasonable endeavours to support and participate in relevant critical event briefings as resources permit.

### **2.2.10. Maintain systems to collect data and flood information**

The Bureau will maintain the systems to ingest all data being gathered through the special purpose flood warning data network.

The river height and rainfall data received by the Bureau will be published as soon as practicable (the data are supplied at different frequencies and by various methods) upon receipt into Bureau operational systems. The data will be published in the form of tables, maps and plots and will also be included in warnings and used in modelling systems.

Data collected in Bureau systems will be available for use by the Bureau as it requires and for distribution to the public on suitable open-source licence terms<sup>1</sup>.

## Service Level Specification for Flood Forecasting and Warning Services for Queensland

The Bureau maintains flood brochures on its website that provide an overview of each catchment in Queensland. In addition, maps and metadata are available on the

[National Flood Gauge Network | Australian Water Data Service](#)

### **2.2.11. Planning and liaison**

The Bureau undertakes a range of routine planning, maintenance and liaison activities that support the Total Flood Warning System. This includes contributing to related flood risk management activities within the State or Territory impacting on or related to flood warnings along with the ongoing coordination and liaison activities essential to the smooth operation of the Total Flood Warning System.

### **2.2.12. Support for emergency management training and exercises**

The Bureau will, within operational constraints, endeavour to support and participate in relevant disaster management activities outside of flood operational periods, including training exercises and flood response planning.

## **2.3. Level of service and performance reporting**

Achievable levels of performance provided by the Bureau are dependent on many factors including adequate access to Bureau equipment. Where located on sites owned by other agencies, data availability in near real time from Bureau and partner agencies, modelling and prediction capability, geomorphology of the catchment and meteorological considerations such as rainfall patterns.

If during a flood event the achievable service level is expected to be reduced, for any reason, below the target level as stated in this SLS, the Bureau will inform the key emergency management clients in Queensland of the reduced service level via email and phone.

Event based performance reports with more detailed technical information may also be produced for significant and high-profile events.

### **2.3.1. Limitations of service**

The performance of services provided under this document are subject to:

1. The availability of funds and human resources of the Bureau and its partner agencies and changes to organisational policies that may affect the terms and conditions of the SLS.
2. Circumstances beyond the control of the Bureau including where the performance is the responsibility of another entity.
3. The existence of a reliable and ongoing supply of quality real time rainfall, water level and flow data.
4. The reliable and ongoing availability of the computing and communication infrastructure required for the performance of the services.
5. Adequate communication between the Bureau and all relevant partners under this SLS and related Data Sharing Agreements and any other agreement relevant to it including on any faults or issues.

This SLS is not a replacement, nor does it reduce the value of any Queensland documents and agreements that describe the State's arrangements for flood warning and flood risk management arrangements that may exist.

## **2.4. Consultation, review and update process**

The initial and annual process for acceptance of this SLS will be:

1. The FWCC members will be provided with the draft or amended SLS.
2. The FWCC members will provide feedback from their organisation at the committee meeting.
3. After consultation and discussion at the FWCC meeting, the Bureau will update the SLS.
4. The Chair of the FWCC will accept and sign the document on behalf of the committee.
5. The SLS will then be authorised on behalf of the CEO and Director of Meteorology.
6. The Bureau will then distribute the SLS to all members of the FWCC.
7. A copy of the SLS will be published on the Bureau website.

The schedules of this SLS will be reviewed annually and either updated following review, or when a significant change is made that impacts the level of services described in this document.

Any changes to the categorisation of a location into data, information or forecast location or to the level of services described in this document will be through a consultative process using agreed arrangements in Queensland and when required coordinated by the FWCC.

## 2.5. Signature of parties

This Service Level Specification has been prepared by the Bureau of Meteorology in consultation with the Queensland Flood Warning Consultative Committee.

Approval from the relevant managers have been obtained on the dates shown below:

Date 18/12/2025

Chair of Queensland Flood Warning Consultative Committee  
Manager, Hazard Preparedness and Response (QLD) or delegate  
Decision Support Services  
Bureau of Meteorology

Date 18/12/2025

General Manager, Decision Support Services  
Bureau of Meteorology

Date 18/12/2025

General Manager, Environmental Prediction Services  
Bureau of Meteorology

## Schedule 1: Flood Warning Consultative Committee

The Queensland Flood Warning Consultative Committee was formed in 1990. The Committee's role is to coordinate the development and operations of the State's flood forecasting and warning services. It is an advisory body and reports to the Bureau and participating State and local government agencies twice each year. The current membership includes

- Bureau of Meteorology (Chair/Secretariat)
- Queensland Police Service
- Queensland Department of Local Government, Water and Volunteers
- Queensland Department of Transport and Main Roads
- Queensland Inspector-General Emergency Management
- Queensland Reconstruction Authority
- Seqwater (Queensland Bulk Water Supply Authority trading as Seqwater)
- Sunwater
- Local Government Association of Queensland
- Floodplain Management Australia

Additional organisations invited to participate include:

- Queensland State Emergency Service
- Rotating council representation (3 representatives per meeting)

The nationally consistent Terms of Reference for Flood Warning Consultative Committees are:

1. Identify requirements and review requests for new and upgraded forecasting and warning services.
2. Establish the priorities for the requirements that have been identified using risk-based analyses of the Total Flood Warning System.
3. Review and provide feedback on the SLS for the Bureau's flood forecasting and warning services on an annual basis.
4. Coordinate the implementation of flood warning systems in accordance with appropriate standards.
5. Promote effective means of communication of flood warning information to the affected communities.
6. Monitor and review the performance of flood forecasting and warning services.
7. Build awareness and promote the Total Flood Warning System concept.

## Schedule 2: Forecast locations and levels of service

### Column definitions:

Bureau number: Refers to the unique number assigned to a particular station by the Bureau

Forecast location: Is the specific location that will be referred to in flood warnings (refer section 2.2.1)

Station owner: Refers to the owning and operating agency of the station. The Bureau may co-own stations. (refer Schedules 7 and 8)

Gauge type: Either manual (read by human) or automatic (consisting of either ALERT or telemeter gauges)

Flood classification: For definitions, please refer to Glossary.

Prediction type: The type of warning service that a particular location can expect. (refer section 2.2.5)

Target warning lead time: The minimum lead time that will be provided before the height or the flood class level given is exceeded (refer section 2.2.5)

Target peak accuracy: The error within which peak river level height is predicted (refer section 2.2.5)

Priority: The impact a temporary or permanent loss of a site will have on service delivery and in meeting performance targets (refer 2.2.1)

## Service Level Specification for Flood Forecasting and Warning Services for Queensland

| Bureau number              | Forecast location | Station owner                  | Gauge type | Flood classification (m) |          |       | Prediction type | Target warning lead time |                    | 70% of peak forecast s within | Priority |

**Notes:**

- <sup>1</sup> Forecasts at both Moggill and Jindalee are provided on both the rising and falling limbs of the flood hydrograph, and are in conjunction with forecasts provided for the Brisbane City tide gauge
- <sup>2</sup> Forecasts at Miva refer to the river reaches directly downstream of the township.
- <sup>3</sup> Moderate flood levels at Bundaberg Township are likely when forecasts at Walla exceed 14m.
- <sup>4</sup> Forecasts at Rockhampton are provided on both the rising and falling limb of the flood hydrograph.
- <sup>5</sup> Forecasts at Mackay are provided in Australian Height Datum as well as local tide datum.
- DLGWV = Department of Local Government, Water and Volunteers
- Bureau = Commonwealth Bureau of Meteorology

## Schedule 10: Flood warning related products issued by the Bureau in Qld (warnings, watches, bulletins)

### Flood warnings

#### Issuing of warnings

Flood warnings are issued when one or more of the following criteria are met:

- i. The river level of at least one forecast location (listed in Schedule 2) is expected to reach and or exceed or has exceeded the minor flood level;
- ii. The flood class levels or trigger heights defined at forecast locations are expected to be exceeded (refer to Schedule 2);
- iii. River levels above the minor flood levels are expected at widespread information locations (refer to Schedule 3).

Catchments for which we do not offer a formal flood warning service (e.g. Pine, Caboolture, Brisbane Creeks etc.) are not covered by these warnings.

#### Finalising of warnings

Flood warnings are finalised when river heights at forecast locations have fallen below the minor flood level and renewed rises or further significant rainfall are not expected.
