Service Level Specification for Flood Forecasting and Warning Services for New South Wales and the Australian Capital Territory – Version 3.16

Service Level Specification for Flood Forecasting and Warning Services for New South Wales and the Australian Capital Territory

This document outlines the Service Level Specification for Flood Forecasting and Warning Services provided by the Commonwealth of Australia through the Bureau of Meteorology for the State of New South Wales in consultation with the New South Wales and the Australian Capital Territory Flood Warning Consultative Committee.

List of Schedules

Schedule 1: Terms of Reference Flood Warning Consultative Committee	17
Schedule 3a: Information locations with flood classification levels defined	26
Schedule 3b: River and rainfall alert conditions.....	28
Schedule 4: River data locations.....	29
Schedule 5: Enviromon base stations installed in New South Wales and the Australian Capital Territory	51
Schedule 6: List of sites owned and maintained by the Bureau.....	53
Schedule 7: List of sites where the Bureau assists other agencies with maintenance	62
Schedule 8: List of sites where the Bureau co-locates equipment and the site is owned by another agency.....	63
Schedule 9: List of flood warning related products issued by the Bureau in New South Wales and the Australian Capital Territory (warning, watches, bulletins, river alerts).....	65
Schedule 10: Changes to this Service Level Specification	69

List of Appendices

Appendix A: Glossary of terms.....	71
Appendix B: References	74

1 Introduction

- 1.1** The purpose of this Service Level Specification is to document and describe the flood forecasting and warning services provided for by the Bureau of Meteorology (the Bureau) in New South Wales and the Australian Capital Territory.
- 1.2** The Bureau's flood forecasting and warning services are provided within the context of the Total Flood Warning System as defined in the Australian Emergency Manuals Series, Manual 21 Flood Warning (Australian Government, 2009 and illustrated in Figure 1).

Figure 1: The components of the Total Flood Warning System (Australian Emergency Manual Series, Manual 21 Flood Warning, Australian Government 2009)

- 1.3** The Total Flood Warning System recognises that a fully effective flood warning service is multi-faceted in nature and its development and operation involves input from several agencies each with specialised roles to play. It is vital that the agencies involved work in close cooperation through all stages of developing and operating the system. The services described here are the Bureau's contribution to the Total Flood Warning System.
- 1.4** The Bureau's main role in the Total Flood Warning System is focussed on monitoring and prediction, and to a lesser extent interpretation, message construction and communication components (see Appendix A for descriptions). The Bureau also contributes to the review activities and takes a role in the planning and coordination activities associated with ensuring

that the activities of all agencies and appropriate linkages are well coordinated. The roles and responsibilities of all key stakeholders involved in the provision of a flood warning service in New South Wales and the Australian Capital Territory are described in the National Arrangements for Flood Forecasting and Warning (Bureau of Meteorology, 2015)¹.

- 1.5** This Service Level Specification is concerned with describing the Bureau's role in the Total Flood Warning System and its interaction with other stakeholders as described in the National Arrangements. This is to ensure that the service the Bureau is providing in support of each of the relevant components of the Total Flood Warning System is understood by the Bureau and other stakeholders.
- 1.6** A description of the activities that make up the Bureau's flood forecasting and warning services for New South Wales and the Australian Capital Territory is given in Section 3. This set of activities, associated products and target levels of service constitute the current standard services provided freely by the Bureau. The Bureau also provides supplementary services on a commercial or cost recovery basis but they are not covered in this document.

¹ The National Arrangements for Flood Forecasting and Warning (2015) is available on the Bureau's website: <http://www.bom.gov.au/water/floods/index.shtml>

2 Flood Warning Consultative Committee

- 2.1** The New South Wales and the Australian Capital Territory Flood Warning Consultative Committee provides the Bureau's key stakeholders with a consultation mechanism for its flood forecasting and warning services. As such, the committee is responsible for reviewing this Service Level Specification on an annual basis or as required.
- 2.2** The overall role of the New South Wales and the Australian Capital Territory Flood Warning Consultative Committee is to coordinate the development and operation of flood forecasting and warning services in New South Wales and the Australian Capital Territory, acting as an advisory body to the Bureau and participating State and Local government agencies. Membership and terms of reference for this committee in New South Wales and the Australian Capital Territory are detailed in Schedule 1.
- 2.3** The Bureau chairs and provides the secretariat support to the New South Wales and the Australian Capital Territory Flood Warning Consultative Committee, which meets six monthly depending on need and activity.

3 Bureau flood forecasting and warning services

3.1 The scope of services covered by this Service Level Specification is confined to those dealing with riverine flooding caused by rainfall where typical rain-to-flood times are six hours or more. Flash flooding (rain-to-flood times less than six hours) and flooding caused purely by elevated sea levels are not covered, nor are the weather forecasting and other services the Bureau provides that contribute to the flood forecasting and warning service, including Severe Weather and Severe Thunderstorm Warnings, Tropical Cyclone Warnings, provision of radar data and rainfall forecasts. Schedule 2 is an up-to-date version (as of December 2025) of the information contained in the New South Wales State Flood Plan (NSW State Emergency Service, 2021) supporting document Provision and Requirements for Flood Warning in New South Wales (NSW State Emergency Service, 2019) which also defines warning lead time requirements for most locations.

3.1.1 In New South Wales and the Australian Capital Territory flood warnings are also provided for 13 smaller catchments with faster catchment response times (rain-to-flood times less than six hours) that have specialised warning systems in place. The reliability of the service for these locations is not as high as for other sites along the major streams listed in Schedule 2.

3.2 The nature of the services covered by this Service Level Specification include undertaking the routine catchment monitoring and river height prediction activities necessary for operation of the Total Flood Warning System, as well as issuing and publishing specific warning and data products. These activities are listed below with further detail and associated performance measures provided in subsequent sections.

- Collect and publish rainfall and river level data
- Routine monitoring of flood potential
- Flood modelling and prediction
- Automated information and alerting
- Issue flood watches
- Issue flood warnings
- Communication of flood warnings and flood watches
- Data networks, communications and storage
- Operations
- Maintain systems to collect data and flood information
- Prevention, planning and liaison activities
- Support for emergency management training and training exercises

3.3 Collect and publish rainfall and river level data

3.3.1 The collection and publishing of rainfall and river level data is an important component of the overall service. Apart from use by the Bureau for data analysis and its hydrological modelling for flood predictions, the data is also used by the emergency service agencies, numerous operational agencies, businesses and the public to monitor rainfall and river conditions. The data is also used by the lead flood hazard agency and councils who use the data for flood model calibration and validation. These gauges may also be used for non-flood related purposes such as water resource and environmental management. To assist in describing the service, the locations where river height; dam, weir or lake level; and tidal observations are made are categorised into three types; namely forecast location (Schedule 2), information location (Schedule 3a and 3b) and data location (Schedule 4).

- **Forecast location** is a location for which the Bureau provides a forecast of future water level either as the classification of flood that is predicted (minor, moderate or major) or as a level and classification. Refer to Appendix A for definitions. At these locations observed data, flood classifications and additional qualifying information will also be available (Schedule 2).
- **Information location** is a location at which flood classifications are defined and observations of water level data are provided. At these locations forecasts of future water level are not produced. Other key thresholds may be defined and reported against (Schedule 3a and 3b)

3.3.2 Data location is a location for which just the observed water level data is provided. Flood classifications are not available for these locations and forecasts of future water level are not produced (Schedule 4). An indicative level of priority has been assigned to each observing site and key communication infrastructure such as radio repeaters (Schedules 2-4 and 7-9) based on a three-tiered scheme (Table 1). The priority level is based on the expected impact to the Bureau's services. The impacts identified are the expected outcome of a service outage at that site during a flood emergency. Impact is described in terms of forecast performance and the Bureau's ability to provide a flood warning service.

3.3.3 The scope of this priority scheme considers the requirements of forecasting and prediction only and should not be confused with any other priority assigned to that site by third party owners or other users.

Table 1: Site Priority

Priority Level	Impact on performance	Impact on service delivery	Description
High	Very difficult to meet target	Direct and significant high level impact for the site and/or downstream locations	Degradation of service highly likely.
Medium	Difficult to meet target	Some impact for the site and/or downstream locations.	Possible degradation of service.
Low	Not likely to affect meeting targets	Little impact on the site and/or downstream location	Low possibility of degradation of service.

Note: Multiple outages within a given network will lead to a higher impact and greater service degradation. Table 1 indicates the effect of a single site failure within an otherwise functional network.

3.4 Routine monitoring of flood potential

3.4.1 The Bureau will maintain an awareness of catchment conditions and monitor the potential for riverine flooding. This monitoring activity will be supported by the Bureau's weather services as required and is an activity undertaken to plan future flood operations.

3.5 Flood modelling and prediction

3.5.1 The Bureau will develop and maintain prediction systems for the forecast locations listed in Schedule 2.

3.5.2 The Bureau prediction systems include real-time hydrologic models, simple peak to peak correlations and other hydrologic techniques as appropriate.

3.5.3 The Bureau prediction systems will be maintained and updated following significant events or when new data becomes available.

3.5.4 The target level of performance for the prediction at each forecast location is given in Schedule 2.

3.6 Automated information and alerting

3.6.1 A threshold-based rainfall and river alerting service is provided to the New South Wales State Emergency Services which sends simple SMS and email messages based on rainfall rates as outlined in Schedule 3b.

3.7 Issue flood watches

3.7.1 The Bureau will issue flood watches when the combination of forecast rainfall and catchment conditions indicates flooding is possible. The catchments and basins covered by flood watches include all those listed in Schedule 10. Flood watches may cover catchments that do not have established flood warning services.

3.7.2 The primary purpose of a flood watch is to provide early advice to communities and the relevant emergency service organisations of the potential flood threat from a developing weather situation. Typically, a flood watch is issued one to four days before an anticipated flood event depending on the confidence in rainfall forecasts.

3.7.3 Flood watches will be communicated using the dissemination methods detailed in section 3.9.

3.8 Issue flood warnings

3.8.1 In general flood warnings are issued based on the following criteria:

- The flood classification levels or trigger heights defined at a forecast location are expected to be reached or exceeded, or has been exceeded (refer to Schedule 2);
- River levels above the minor flood levels are expected at widespread information locations (refer to Schedule 3).

The specific initiating criteria, if any, for each flood warning product is listed in Schedule 10.

3.8.2 Flood warnings may include either **qualitative** or **quantitative** predictions at forecast locations or a statement about future flooding in more **generalised** terms as outlined in Table 2. The type of prediction is commensurate with user requirements, the availability of real time rainfall and river level data, and the capability of available flood prediction systems. A flood warning may contain **generalised, quantitative and qualitative** predictions and typically start with more **generalised** information and become more specific as data becomes available as the event develops and progresses.

- 3.8.3** In New South Wales and the Australian Capital Territory, the Bureau will issue flood warnings with either **quantitative** and/or **qualitative** predictions, for those catchments, and the locations within those catchments (consistent with the requirements for The Provision and Requirements for Flood Warning in New South Wales - Supplementary Document to the State Flood Plan (2024)) as listed in Schedule 2.
- 3.8.4** **Quantitative** predictions include expected flood classification (minor, moderate or major) with specific information on the height and time of water levels at the forecast locations identified in Schedule 2. A **quantitative** prediction can be a specific level or a range of levels and has timing to a minimum resolution of 3-6 hours. **Quantitative** predictions are based on all available information at the time of warning issue. The target lead time of the river height prediction for each forecast location where **quantitative** predictions are provided is given in Schedule 2. For an example of a **quantitative** prediction refer to Table 2.
- 3.8.4.1** For the Bureau to be able to provide a **quantitative** prediction at a location, it is essential to have a suitable network of rainfall and river level sites upstream with data coming in real time, sufficient historical data to calibrate the flood forecasting model, a reliable rating table and documented flood impacts and flood classifications.
- 3.8.5** **Qualitative** predictions include expected flood classifications (minor, moderate or major) and timing of flooding at the forecast locations identified in Schedule 2. The timing is indicated in blocks of six, 12 or 24 hours, using the terms such as early morning, afternoon or overnight. Such predictions are based on all available information at that time and may include advice on the peak classification that is expected or has occurred at that location. The target lead time for each forecast location where only **qualitative** predictions are provided are given in Schedule 2. For an example of a **qualitative** prediction refer to Table 2.
- 3.8.5.1** For the Bureau to be able to provide a **qualitative** prediction at a location, it is essential to have at least some rainfall and river level sites upstream of the location with data coming in real time, at least some historical flood data to calibrate the flood forecasting model, a reasonable rating table and documented flood impacts and flood classifications.
- 3.8.6** The Bureau may also issue flood warnings with more **generalised** predictions and information when there are not enough data to make specific predictions or in the developing stages of a flood. These warnings contain generalised statements advising that flooding is expected and may include forecast trend (rising or falling) (for examples refer to Table 2).
- 3.8.7** The typical target accuracy of a **quantitative** water river level prediction is that 70% are within 0.3 or 0.6 metres of the observed water level. Specific accuracy targets by location are defined in Schedule 2. Achievement of these targets is not possible in all floods or at all locations. In general predictions of a flood peak are more accurate than “reach” or “exceed” predictions that are issued during the developing stages of a flood. This is due to uncertainty of future rainfall rates and/or upstream flood behaviour that are used when making those predictions.
- 3.8.8** A list of the flood warnings issued in New South Wales and the Australian Capital Territory, along with the basin/river to which they apply is included in Schedule 10. Details about forecast locations in each basin/river are included in Schedule 2.

Table 2. Prediction types description

Prediction type	Height prediction	Time of prediction	Example
Quantitative	Numerical prediction - Any Height - Peak Height Can refer to flood classification	More specific, typically in blocks of 3 to 6 hours	The Clarence River at Grafton will exceed the minor flood level (2.1 metres) around 3 pm Saturday evening. The Clarence River at Grafton is expected to peak near 6.5 metres with (major flooding) around 6 pm on Sunday.
Qualitative	Refers to flood classification (minor, moderate or major)	Range of times (6, 12 or 24 hour blocks)	Minor flooding is expected in the Hunter River at Singleton during Saturday afternoon. The Hunter River at Singleton is expected to peak above the major flood level (13.0 metres) during Sunday evening.
Generalised	No height prediction - forecast trend (rising or falling)	Range of times (24 hour blocks)	Flooding is expected along the Orara River at Coutts Crossing during Saturday with higher levels possible depending on future rainfall.

3.9 Communication of flood warnings and flood watches

3.9.1 Flood watches and warnings will be issued directly to a list of stakeholders with emergency management responsibilities. This list is maintained by the Bureau but is not detailed in this document. The direct dissemination methods supported include email, and the internet protocols such as File Transfer Protocol (FTP).

3.9.2 The format of messaging in flood related products will conform to a nationally consistent standard determined by the Bureau, in consultation with the Flood Warning Consultative Committee.

3.9.3 Flood watches and warnings are also communicated by the Bureau via:

3.9.3.1 Radio: Radio stations, particularly the ABC, broadcast flood warning information as part of their news bulletins, or whenever practicable. This form of broadcast may be covered in separate agreements between the Bureau and broadcasters.

3.9.3.2 Weather warning service: Flood warning information is recorded on a contracted telephone information service. Calls to this service incur a fee-for-service charge.

3.9.3.3 Internet: Flood watches and Warnings are published on the Bureau's public web site and available by File Transfer Protocol (FTP) and Rich Site Summary (RSS) along with related rainfall and river level information (see 3.12).

3.9.3.4 Social Media: The Bureau endeavours to issue Tweets related to flood watches, flood warnings and relevant information, subject to operational constraints and in connection with other weather information. The

Bureau website remains the main platform for the publishing of flood information.

3.9.3.5 Bureau Weather app: App users can enable Flood Watch and Flood Warning push notifications for their set location in the BOM Weather app. State/territory-based warnings are also available on the Warnings screen in the app, and on the Bureau website.

3.9.4 Emergency management partners², flood hazard leaders, and media can also access flood level and warning information directly from the Bureau subject to operational constraints. The Bureau does not publish to the public the contact details for the Operations Centres or teams.

3.10 Data networks, communications and storage

3.10.1 The services to be provided by the Bureau under this Service Level Specification depend on provision of data from networks of stations owned and operated by the Bureau and partner agencies. Permanent or temporary loss of real time data may necessitate a downgrading of the flood warning service from **quantitative** predictions to **qualitative** or then **generalised**.

3.10.2 The Bureau contribution to this network of stations includes:

- the operation and maintenance of equipment at the sites which are fully owned and maintained by the Bureau as listed in Schedule 7.
- assisting with maintenance of equipment for other agencies at the sites listed in Schedule 8.
- operating and maintaining Bureau-owned equipment at sites where this equipment is co-located at a site owned by another agency Schedule 9.

3.10.3 Where the site is owned or operated by other parties, installation, maintenance and repairs of Bureau equipment will depend on adequate access being provided to the Bureau and any of its contractors. The Bureau will confirm access arrangements with relevant land owners before entering the premises. The Bureau also requires that the site operators provide timely advice regarding any possible faults or other issues affecting the performance of the data network.

3.10.4 To ensure the Bureau can provide the required service level for each location type described in 3.3.1, Flood Warning Infrastructure guidelines are available to assist data providers ensure data is fit for purpose. The Bureau's ability to meet requirements may be impacted by infrastructure not designed in conjunction with the guidelines.

3.10.5 The Bureau will maintain the essential set of metadata describing the network of stations and related infrastructure regarding the Bureau's component of the data network, along with metadata required to inform the data ingest process for partner agency related networks and sites.

3.10.6 The Bureau ingests data from 3rd party owned special purpose software (Enviromon). Enviromon is used by these data providers to collect, store, display, provide alerting, and on-forward data from near-real time telemetry networks such

² Emergency management partners include those organisations that have an emergency management responsibility for the wider community (e.g. State Emergency Service)

as Event Reporting Radio Telemetry Systems (ERRTS) based on Automated Local Evaluation in Real Time (ALERT) protocol. Software licenses for existing 3rd party Enviromon instances are listed in Schedule 5.

- 3.10.7** The Bureau will continue to provide the following Enviromon maintenance services to external users until 30 June 2026. These services will be provided Monday to Friday between 9am to 5pm:
- Basic monitoring of data from external base-stations
 - Subject Matter Expert knowledge sharing and technical assistance to resolve data ingestion, processing and software performance issues via email and Teams meetings.
 - Technical assistance for reinstallations and major issues in person. Note that such support will be cost-recovered for both SME time and travel arrangements. Such assistance must be scheduled at least one month in advance and is subject to operational demands

3.11 Operations

- 3.11.1** The Bureau will use reasonable endeavours to provide 24 hours a day, seven days a week operational systems capability necessary to support flood warning operations. This will include on-line computer and data ingestion systems, along with appropriate communications infrastructure.
- 3.11.2** The Bureau operates the National Flood Warning service which is scaled to meet flood risk.
- 3.11.3** Through the Community Services Group (specifically Decision Support Services (Hazard Preparedness and Response) and Environmental Prediction Services), the Bureau will provide operational coverage for up to 24 hours per day during flood events, subject to event requirements and operational constraints. The Bureau will advise its key emergency management clients of any impact in services if it is unable to provide sufficient staff coverage to meet the service levels set out in this Service Level Specification (see also 4.2)
- 3.11.4** The Bureau will maintain an internal technical guide for each catchment where a warning service is provided. The technical guide documents and describes the forecast process for the particular catchment and includes flood intelligence information, flood history, and warning issue criteria.
- 3.11.5** The Bureau's operation of the flood warning service will be compliant with the fatigue management guidelines developed under the Bureau's Work Health and Safety Procedures. Particular attention to fatigue management will be provided during the management of extreme events. The requirement to comply with these guidelines applies to all Bureau personnel.
- 3.11.6** The Bureau will assist in meeting the needs of the Australian Government's National Situation Room. Through the National Hazard Preparedness and Response team, the Bureau will use reasonable endeavours to support and participate in relevant critical event briefings as resources permit.

3.12 Maintain systems to collect data and flood information

- 3.12.1** The Bureau will maintain the systems to ingest all data being gathered through the flood warning data network.
- 3.12.2** The river height and rainfall data received by the Bureau will be published as soon as practicable (the data is supplied at different frequencies and by various methods) upon receipt into Bureau operational systems. The data will be published in the form of tables, maps and plots and will also be included in warnings and alerting messages and used in modelling systems.
- 3.12.3** Data collected in Bureau systems will generally be available for use by the Bureau as it requires and for distribution to the public on suitable open-source licence terms³. Data is subject to quality control and may be removed from public distribution at times if it is not suitable or accurate.
- 3.12.4** The Bureau will continue to collect and update the flood background information contained on its website. These include survey information, flood history and flood event reports and brochures.

3.13 Prevention, planning and liaison activities

- 3.13.1** The Bureau undertakes a range of routine planning, maintenance and liaison activities that support the Total Flood Warning System. This includes contributing to related flood risk management activities within the State or Territory impacting on, or related to flood warning along with the ongoing coordination and liaison activities essential to the smooth operation of the Total Flood Warning System.

3.14 Support for emergency management training and exercises

- 3.14.1** The Bureau will, within operational constraints, endeavour to support and participate in relevant disaster management activities outside of flood operational periods, including training exercises and flood response planning.

³ Please refer to the Creative Commons License:
<http://www.bom.gov.au/water/regulations/dataLicensing/ccLicense.shtml>

4 Level of service and performance reporting

- 4.1** Achievable levels of performance provided by the Bureau are dependent on many factors including adequate access to Bureau equipment where located on sites owned by other agencies, data availability in near real time from Bureau and partner agencies, modelling and prediction capability, geomorphology of the catchment and meteorological considerations such as rainfall patterns.
- 4.2** If during a flood event the achievable service level is expected to be reduced, for any reason, below the target level as stated in this Service Level Specification, the Bureau will inform the key emergency management clients in New South Wales and the Australian Capital Territory of the reduced service level via email and phone.
- 4.3** The Bureau's performance during significant events will be reviewed and reported on within the context of the Total Flood Warning System using a standard performance structure based on the performance indicators and the service levels defined in Schedule 2.
- 4.4** The annual performance of service report will be tabled at the last Flood Warning Consultative Committee meeting of the calendar year. This report will be published on the Bureau's website (www.bom.gov.au).
- 4.5** Event based performance reports with more detailed technical information may also be produced for significant and high profile events.

5 Limitations of service

5.1 Performance of services provided under this document are subject to:

- (a) The availability of funds and human resources of the Bureau and its partner agencies and changes to organisational policies that may affect the terms and conditions of the Service Level Specification.
- (b) Circumstances beyond the control of the Bureau including where the performance is the responsibility of another entity.
- (c) The existence of a reliable and ongoing supply of quality real time rainfall, water level and flow data.
- (d) The reliable and ongoing availability of the computing and communication infrastructure required for the performance of the services.
- (e) Adequate communication between the Bureau and all relevant partners under this Service Level Specification and related Data Sharing Agreements and any other agreement relevant to it including on any faults or issues.

5.2 In New South Wales and the Australian Capital Territory there are three key documents that describe the arrangements for flood warning and flood risk management. This Service Level Specification does not replace or reduce the value of these documents. The documents are:

- (a) New South Wales State Flood Plan 2021 (New South Wales State Emergency Service) found on Resilience NSW website: <https://www.nsw.gov.au/rescue-and-emergency-management/sub-plans/flood>
- (b) Provision and Requirements for Flood Warning in NSW 2019 (New South Wales State Emergency Service)
- (c) Australian Capital Territory 2023 Flood Sub-Plan of the Territory Emergency Plan (Australian Capital Territory State Emergency Service).

6 Service Level Specification consultation, review and updating

6.1 The initial and annual process for acceptance of this Service Level Specification will be:

- 6.1.1 The Flood Warning Consultative Committee members will be provided with the draft or amended Service Level Specification in advance of a special or scheduled committee meeting.
- 6.1.2 The members of the Flood Warning Consultative Committee will distribute the draft or amended Service Level Specification within their organisations and provide feedback from their organisation at the committee meeting.
- 6.1.3 After consultation and discussion at the Flood Warning Consultative Committee meeting, the Bureau will update the Service Level Specification.
- 6.1.4 The Chair of the Flood Warning Consultative Committee (Bureau's Manager Hazard Preparedness and Response NSW and ACT) will accept and sign the document on behalf of the committee.
- 6.1.5 The SLS will then be authorised on behalf of the CEO and Director of Meteorology.
- 6.1.6 The Bureau will then distribute the Service Level Specification to all members of the Flood Warning Consultative Committee and publish a copy on the Bureau website.

6.2 The schedules of this Service Level Specification will be reviewed annually and either updated following review, or when a significant change is made that impacts on the level of services described in this document. Updates to this document will be recorded in Schedule 11.

6.3 Any changes to the categorisation of a location into data, information or forecast location or to the level of services described in this document will be through a consultative process using agreed arrangements in New South Wales and Australian Capital Territory coordinated by the Flood Warning Consultative Committee.

7 Signature of parties

- 7.1** This Service Level Specification has been prepared by the Bureau of Meteorology in consultation with the New South Wales and the Australian Capital Territory Flood Warning Consultative Committee.

Schedule 1: Terms of Reference Flood Warning Consultative Committee

The New South Wales Flood Warning Consultative Committee was formed in late 1989, and in 2016 was extended to include Australian Capital Territory. The Committee's role is to coordinate the development and operations of the State's flood forecasting and warning services. It is an advisory body and reports to the Bureau of Meteorology and participating state and local government agencies as required. The membership includes:

- Bureau of Meteorology (Chair/Secretariat)
- New South Wales State Emergency Service (NSW SES)
- New South Wales Department of Climate Change, Energy, the Environment and Water (NSW DCCEEW)
- Floodplain Management Australia
- WaterNSW
- Sydney Water
- Australian Capital Territory State Emergency Service
- Australian Capital Territory Government
- Murray Darling Basin Authority (MDBA)
- New South Wales Reconstruction Authority

The nationally consistent Terms of Reference for Flood Warning Consultative Committees are:

1. Identify requirements and review requests for new and upgraded forecasting and warning services.
2. Establish the priorities for the requirements that have been identified using risk based analyses of the Total Flood Warning System.
3. Review and provide feedback on the Service Level Specification for the Bureau's Flood Forecasting and Warning services on an annual basis.
4. Coordinate the implementation of flood warning systems in accordance with appropriate standards.
5. Promote effective means of communication of flood warning information to the affected communities.
6. Monitor and review the performance of flood forecasting and warning services.
7. Build awareness and promote the Total Flood Warning System concept.

The New South Wales and Australian Capital Territory Flood Monitoring Network Working Group is a technical sub-group of the Flood Warning Consultative Committee. The primary task of this Working Group is to support the Flood Warning Consultative Committee in matters relating to monitoring system and networks, with the objective of ensuring the efficacy of the flood warning network by ensuring data is fit for purpose for flood warning purposes.

Schedule 2: Forecast locations and levels of service

Column definitions:

Bureau number: Refers to the unique number assigned to a particular station by the Bureau.

AWRC number: Refers to the unique number assigned to a particular station by the Australian Water Resources Council. Each gauge within Australia is assigned a unique AWRC number.

Forecast location: Is the specific location that will be referred to in flood warnings (refer to Clause 3.3.1).

Station owner: Refers to the owning and operating agency of the station. For some locations there is more than one operating agency maintaining a sensor at the location.

Gauge type: Either manual (read by human) or automatic

Flood classification: For definitions please refer to Appendix A.2.

Prediction type: The type of warning service that particular location can expect. (refer to Clause 3.8)

Target warning lead time: The minimum lead time that will be provided before the height or the flood classification level given is exceeded. (Refer 3.8)

Target peak accuracy: The error within which peak river level height is predicted (refer to Clause 3.8.7)

Priority: The impact a temporary or permanent loss of site will have on service delivery and in meeting performance targets (refer to Clause 3.3.2)

To view the New South Wales State Flood Plan please follow this link: <https://www.nsw.gov.au/rescue-and-emergency-management/sub-plans/flood>

Bureau number	AWRC number	Forecast location	Station owner	Gauge type	Gauge datum	Flood classification (m)			Prediction type	Target warning lead time		70% of peak forecasts within	Priority
						Minor	Moderate	Major		Time (hrs)	Trigger height (m)

Notes:

- ^ Indicates locations where forecasts are provided for small catchments with faster with response times.
- All levels are in metres to Local gauge datums unless indicated otherwise.
- AHD: Australian Height Datum. See Geoscience Australia for further information.
- n/a: Refers to stations flood classifications have not yet been defined by the NSW SES.
- u/s: Refers to upstream levels acting as a trigger for forecasts at the given location.
- AWRC number: Australian Water Resources Council number
- NSW DCCEEW: NSW Department of Climate Change, Energy, the Environment and Water
- Northern RWMP: Northern Regional Water Monitoring Partnership (Victoria), which also includes Murray Darling Basin Authority (MDBA) sites.
- * Indicates this forecast location is running on an interim service, while the Bureau develops improved forecasting tools. There is no determined lead time for this forecast location for the interim service. Best efforts will be made to provide adequate lead time, particularly where confidence is high with regards to the onset of flooding. Please note, warnings will not be issued purely on a high astronomical tide.

Schedule 3a: Information locations with flood classification levels defined

Bureau number	AWRC number	Station name	Station owner	Gauge type	Gauge datum	Flood classification (m)			Priority

Schedule 18: Changes to this Service Level Specification

Version	Date	Update
1.0	20/11/2013	Version 1.0 signed
2.0	March 2015	Additional sentence to clause 1.6 highlighting supplementary services
		Addition of priorities to stations in schedules 2-4 and 7-9. This is defined in clause 3.3.2 and Table 1 which are also new additions.
		Quantitative and Qualitative clauses better described (3.8.3 and 3.8.4)
3.0	June 2016	Additional clause added to include the Bureau's social media service
		Update various network changes throughout the schedules
3.1	August 2018	Update to the schedules
3.11	October 2019	Update schedules 2 and 3.1 to reflect change of forecast location from Canowindra manual to auto gauge
3.12	November 2019	Update to Schedules to correct location names, to be consistent with the State Flood Plan
3.13	March 2020	Addition of Wollombi Flood Classification to Schedule 3
		Addition of Wollombi Water Level Gauges to Schedule 4
3.14	July 2024	Updated: FWCC membership, Schedule 2 includes revised flood classifications for Tuggerah Lake, corrected agency names, station names, and corrected Schedule 10 on criteria for finalising warnings
3.15	August 2024	Update gauge metadata, include EPS GM sign-off
3.16	December 2025	Update of Clause 3.10.11 and 3.10.12. Update of Schedule 2 to include Ballina and Wardell flood Warning Service. Update to Schedule 9 to separate Richmond and Wilsons products. Remove Schedule pertaining to discontinued DSA's. Update to other schedules.

Appendix A: Glossary of terms

A.1. General

Bureau's Operating Model: The Bureau's Community Services Group delivers forecasts, warnings and expert advice to Emergency Management and the Australian Community, through 3 core Programs:

National Production capability delivered by meteorologists to lead and develop 24/7 national forecasts and guidance, providing national situational awareness and the operational response.

Environmental Prediction capability, delivered by specialist meteorological, hydrological and climatological experts, providing forecast and warning products.

In relation to floods, the National Water Operations Team (NWOT) assesses the riverine flood risk daily for all river catchments in Australia. During periods of heightened flood risk, the NWOT operates 24/7 to issue Flood Watches and Flood Warnings at least every 12-24 hours, but as frequently as every 3 hours in dynamic situations.

Specialist severe weather meteorologists provide updated warnings for heavy rainfall and severe thunderstorms which may be conducive to flash flooding. These warnings are issued when set thresholds are met as defined in the 'Thunderstorm and Severe Weather Service Level Specification' and updated at least every 6 hours.

Decision Support capability delivered by meteorological, hydrological, climatological and communication experts in all States and Territories and through Bureau staff embedded in emergency services operating centres. These staff provide domain expertise, local/regional knowledge and insights through brief and advice services to customers, including the Australian community and emergency management agencies and first responders.

Flood warning: Flood Warnings are issued when flooding at a forecast location is expected to reach and/or exceed a flood classification (or has already done so). A Flood Warning may also be issued when a flood classification has been reached or exceeded, in one or more locations (including at multiple information locations), or as specified in the service level specification. Flood Warnings are updated at an appropriate frequency to the catchment, flood severity, and flood phase.

Flood watch: A Flood Watch provides early advice of increased flood risk over an area up to four days before the onset of possible flooding. A Flood Watch is issued when hydrological and meteorological guidance indicates that at least minor flooding is possible at forecast locations and/or when guidance indicates an increased risk of flooding causing impacts, in consultation with emergency management agencies. The Flood Watch product is provided for all catchments in New South Wales.

NEMA - National Emergency Management Agency: The Australian Government National Emergency Management Agency has been designed to connect relevant Australian Government, State and Territory agencies to centralise the coordination and management of the national-level response during complex national emergencies, developing a single, timely and consistent picture or understanding of a crisis, its implications and the national capacity to respond.

National Flood Warning Arrangements: The National Arrangements outline the general roles and responsibilities of each level of Government in providing and supporting an effective flood warning service and includes separate chapters describing the specific arrangements and agency roles that apply in each jurisdiction.

Protective behaviour: generating appropriate and timely actions and behaviours from the agencies involved and from the threatened community.

Severe Thunderstorm: A thunderstorm is characterised by sudden electrical discharges, each manifested by a flash of light (lightning) and a sharp rumbling sound. Thunderstorms are associated with convective clouds (cumulonimbus) and are usually accompanied by precipitation. Thunderstorms are often short-lived and impact on only a small area. Severe thunderstorms may last for an hour or more and can have a more widespread impact.

A severe thunderstorm will also have one or more of the following phenomena:

- Tornado
- Wind gust of 90 km/h (49 knots) or more
- Hailstones with diameter of 2 cm or larger
- Very heavy rain sufficient to cause flash flooding

Technical Guide: A Technical Guide exists for each Flood Warning Product and provides guidance specific to a catchment to help develop forecasting and warning products.

Weather warnings: Weather warnings are messages sent out by the Bureau to warn the community of potentially hazardous or dangerous weather conditions. Such warnings include but are not limited to: road weather alerts, severe thunderstorm warnings, severe weather warnings for heavy rain, strong or gale force winds, marine wind warnings, warnings for sheep graziers and frost warnings. More information on weather terms is given in the [Bureau's glossary](#).

A.2. The components of the Total Flood Warning System

Based on the Manual 21 Australian Emergency Manual Series, Australian Government 2009 (see the Manual for more details).

Communication: disseminating warning information in a timely fashion to people and organisations likely to be affected by the flood (see Chapter 6).

Interpretation: identifying in advance the impacts of the predicted flood levels on communities at risk (see Chapter 4).

Message construction: devising the content of the message which will warn people of impending flooding (see Chapter 5).

Monitoring and prediction: detecting environmental conditions that lead to flooding, and predicting river levels during the flood (see Chapter 3),

Review: examining the various aspects of the system with a view to improving its performance (see Chapter 7).

A.3 Flood classifications

The classification of minor, moderate and major flood levels at key river height stations is based upon the effect of flooding for some distance upstream and downstream of that station. These levels are determined using the following descriptive categories of flooding, historical data or relevant local information.

The process for establishing flood classification levels involves determining local flood effects, review and endorsement by relevant stakeholders and passing recommendations to the Bureau for inclusion in forecast and warning procedures. The process for establishment of flood classification levels specific to each State and Territory is documented in the National Arrangements.

- Minor flooding - Causes inconvenience. Low-lying areas next to watercourses are inundated. Minor roads may be closed and low-level bridges submerged. In urban areas inundation may affect some backyards and buildings below the floor level as well as bicycle and pedestrian paths. In rural areas removal of stock and equipment may be required.
- Moderate flooding - In addition to the above, the area of inundation is more substantial. Main traffic routes may be affected. Some buildings may be affected above the floor level. Evacuation of flood affected areas may be required. In rural areas removal of stock is required.
- Major flooding - In addition to the above, extensive rural areas and/or urban areas are inundated. Many buildings may be affected above the floor level. Properties and towns are likely to be isolated and major rail and traffic routes closed. Evacuation of flood affected areas may be required. Utility services may be impacted.
